

# Pasture and Hayland Planting

Conservation Practice Job Sheet (512)

Native Grass Planting

Kentucky

Natural Resources Conservation Service (NRCS)

August 2003

Participant Name \_\_\_\_\_

**INFORMATION ON THIS JOB SHEET IS  
CONSIDERED TO BE PART OF THE  
CONTRACT AND/OR CONSERVATION  
PLAN.**

## Definition

This Pasture and Hayland Planting job sheet will be used in establishing pure native warm season grass stands and mixed stands of native grass and compatible legumes and/or forbs as part of a conservation plan.

## Purpose

Establish native warm season grasses, legumes, and forb species to provide forage, hay, and/or wildlife habitat for grassland dependent species.

## Conditions Where Practice Applies

This practice applies on cropland, pastureland, hayland, and other lands where native grasses are needed for forage, hay, or wildlife habitat. (Check program rules to determine if and when hay removal is allowed).

## Establishment Specifications

1. Native grass and native grass mixtures that include forbs will be seeded between April 15<sup>th</sup> and June 30<sup>th</sup>. When planting legumes with native grasses, planting should occur between April 15<sup>th</sup> and May 15<sup>th</sup>. Legumes can also be over seeded during the fall or spring after native grass planting. (Annual legumes may only be seeded during the spring.)
2. Species, seeding rates and seeding dates will be according to Table 3.

3. Seed will conform to minimum state standards for purity, germination and other features. Seed tags and other information may be requested by NRCS representatives to verify contract compliance.
4. Soil amendments, when planned, shall be made according to University of Kentucky fertilizer and lime recommendations. Nitrogen is not authorized for payment on native grass plantings. See Table 3 for more detail on soil amendments.
5. Competition control, seedbed preparation and seeding shall be done according to the following.

## Competition Control Before Planting

Competition control is critical to ensuring a good stand of native grass. Conventional seedbed preparation, herbicide application or both may be used to control competition prior to planting.

Several steps are required to get successful competition control when using a herbicide especially on fescue stands. The first step in killing fescue is to mow or graze the area in late summer for a fall herbicide burn down or in late summer or early spring for a spring herbicide burn down. If possible after mowing and prior to herbicide application, remove the hay to provide a better seed bed and allow for better herbicide contact with vegetation.

(Check program rules to determine if hay removal is allowed).

If needed, a second herbicide application should be planned. This application should occur just prior to native grass planting and after the remaining vegetation has regrown to a 6 - 8 inch height. All herbicide applications shall be made when vegetation is actively growing.

A second herbicide application is recommended for dense fescue or orchard grass stands and other areas where competition may not be controlled by one herbicide application. Table 1 provides some options for controlling competition prior to planting. Herbicide application shall be made according to Table 2.

### Seeding and Seedbed Preparation

Important: Regardless of the seeding method used, seeding depth should never exceed  $\frac{1}{4}$  inch. Avoid no-till planting or cultipacking planted seedbeds in wet soil since it may result in placing the seed too deep. Have some seed on the surface is better than having it too deep.

No-till establishment is the preferred method since soil disturbance is minimum, thus reducing weed competition and soil erosion. Conventional seeding may be used for establishment on areas that have been recently cropped where weedy competition will be lessened and where the risk of erosion is minimal.

### No-Till Seeding

Smooth seeded species like Switchgrass can be planted using a conventional drill with the legume box set to place the seed  $\frac{1}{4}$  inch deep.

Fluffy seeded species will need to be seeded with a no-till drill specialized to plant these seeds. These specialized drills have seed boxes with dividers and agitators, picker wheels, and oversized drop tubes. Specialized drills are also designed so they can be adjusted to ensure shallow planting depths. Some conventional no-till drills have been retro fitted with a fluffy grass seed box. Care needs to be exercised when setting these drills to ensure that planting depths are no deeper than  $\frac{1}{4}$  inch. Two common mistakes when no-till planting native grasses include pulling the drill too fast and not stopping to check seeding depth often enough.

### Conventional Seeding

Prepare a seedbed by plowing and disking. After disking, make at least one trip over the field using a cultipacker to firm the seedbed. The importance of a dry firm seedbed cannot be over emphasized to ensure proper planting depth.

Broadcast fluffy seed with a drop spreader. When using a cyclone type spreader, a carrier should be used to help distribute the seed. The following carriers may be used: lime at a 200 lbs./acre rate; wheat at a 40 lbs./acre rate; or oats at 32 lbs./acre rate. Since fluffy seed will only broadcast as far as the carrier, make sure your passes overlap to ensure even coverage. If wheat or oats are used as a carrier, mow prior to seed head formation.

After broadcasting, cultipack or roll the seeded area only once to ensure good seed to soil contact and the proper shallow seeding depth.

### Eastern Gama Grass Planting

Eastern Gama grass may be planted into a conventionally tilled seedbed or into grass sod using a corn planter. Since some corn drills do not handle the seed as well as others, a trial run should be conducted prior to the planting operation. Planting depth for Eastern Gama grass shall not be deeper than 1 – 1.5 inches.

### ***Operation and Maintenance***

Competition control remains an important part of native grass establishment for up to two years after planting. To control competition and prevent weed seed formation, native grass stands may be top clipped during this period as recommended by NRCS, Kentucky Department of Fish and Wildlife Resources, or a Technical Service Provider. Post-emergent herbicides like Plateau may also be used to control competition during the two-year establishment period when recommended by one of the above technical service providers.

**If this planting is being established under a program, the participant must follow management requirements as outlined on the program specific Management and Maintenance Job Sheet that is attached.**

Table 1. This table contains several options for controlling competing grasses and weeds during native grass establishment. If two burn downs are planned, records should indicate that herbicide was applied to the field twice. A double rate of herbicide applied once over a field does not constitute two burn downs and will be paid for a single burn down. Eastern Gama Grass, Switchgrass, Virginia Wild Rye and some forbs/wildflowers are not compatible with Plateau herbicide. If Plateau herbicide will be used, check the label to determine which forbs/wildflowers are compatible with Plateau prior to species selection. **All herbicides shall be applied and used according to label recommendations. Some herbicides labels restrict grazing or hay harvest for a period of time after application. Two burn downs are recommended when the dominate species in a field is either fescue or orchard grass.**

Option	Current Condition	Timing	Method
1  Single Burn Down	Grassland Or Cropland	Spring	Remove excess vegetation in fall or winter. Apply tank mixture just prior to planting after vegetation has grown 4 to 6 inches.  Tank Mixture: per acre in April – June 1.5 – 2.0 quarts Roundup Ultra or similar Glyphosate base product. 4 - 8 oz. Plateau* Methylated soybean oil (MSO) or similar adjuvant may be added to the mixture to aid in product effectiveness.
2  Two Burn Downs	Grassland	Fall  And  Spring	Remove excess vegetation in late summer (Aug./Sept.) Apply tank mixture after vegetation has actively grown 4 to 6 inches.  Tank Mixture: per acre in Sept./Oct. 1 to 2 Quarts Roundup Ultra or similar Glyphosate based product. Note: Ammonium Sulfate or other additives may be used when applying herbicide at lower rates.  And  Apply tank mixture just prior to planting and after remaining vegetation grows 4 to 6 inches. Tank Mixture: per acre in April-June 1 to 2 Quarts Roundup Ultra or similar Glyphosate based product. Note: Ammonium Sulfate or other additives may be used when applying herbicide at lower rates.  If needed, 4 - 8 oz. Plateau• plus an adjuvant like methylated soybean oil may be added to the tank mix.
3  Two Burn Downs	Grassland	Spring  And  Spring	Remove excess vegetation in fall or winter. Apply tank mixture after vegetation has actively grown 4 to 6 inches.  Tank Mixture: per acre in April. 1 to 2 Quarts Roundup Ultra or similar Glyphosate based product. Note: Ammonium Sulfate or other additives may be used when applying herbicide at lower rates.  And if green-up occurs two to six weeks after initial spraying.  Apply tank mixture just prior to planting and after remaining vegetation grows at least 4 to 6 inches. Tank Mixture: per acre in April-June  1 to 2 Quarts Roundup Ultra or similar Glyphosate based product. Note: Ammonium Sulfate or other additives may be used when applying herbicide at lower rates.  If needed, 4 - 8 oz. Plateau• plus an adjuvant like methylated soybean oil may be added to the tank mix.

***\*NRCS does not require specific herbicides by trade name. The active ingredient in Roundup is glyphosate. The active ingredient in Plateau is imazameth. Other brands of herbicide containing these ingredients may be substituted, however, application rates, application timing, and results may vary. Additional information regarding vegetation control can be found in the University of Kentucky publication “Weed Management In Grass Pastures, Hay Fields, and Fence Rows” (AGR-172).***

Table 2. The following table contains information about a planned herbicide application(s) to be carried out as part of the contract and/or conservation plan for native grass plantings. Some herbicide applications will be made prior to planting (pre-planting) to burn down existing vegetation. Other applications may be made after planting (post-planting) to help control competition during establishment. All herbicide products must be used according to label specifications.

Field No.	Pesticide (Trade Name)	Application Rate (Amount/Acre)	Tentative Date of Application

Table 3. Species and seeding rates will be according to the information provided in the table below. If planned, the application of soil amendments shall be made according to University of Kentucky fertilizer and lime recommendations. The recommendations must be made from a soil test that is performed according to University of Kentucky laboratory soil test procedures. If additional room is needed on the tables below or above, make copies of this page and attach it to the back of the job sheet.

Field No.	Acres	Species	Lbs./Ac Seed (PLS)*	Total Lbs. (PLS)*	Seeding Method (Conv/No-Till)	Lime Ton/Ac	P2O5 Lbs/Ac	K2O Lbs/Ac	Seeding Date

\* Native grass recommendations are made on a Pure Live Seed (PLS) basis.

Program specific requirements or additional technical recommendations are as follows.
